

# Cross-temporal Probabilistic Forecast Reconciliation: online appendix

30 March 2023

## A Alternative forms of the cross-temporal covariance matrix

In this appendix, some derivations of the solutions proposed in Section 4 to obtain an estimator of the cross-temporal covariance matrix are reported. Starting from the the definition of cross-temporal covariance matrix we obtain the first equivalence in (10). Therefore, we have that

$$\begin{aligned} & \lambda \hat{\mathbf{\Omega}}_{hf-bts,D} + (1 - \lambda) \hat{\mathbf{\Omega}}_{hf-bts} \\ & \Downarrow \\ & \hat{\mathbf{\Omega}}_{HB} = \mathbf{S}_{ct} \left[ \lambda \hat{\mathbf{\Omega}}_{hf-bts,D} + (1 - \lambda) \hat{\mathbf{\Omega}}_{hf-bts} \right] \mathbf{S}_{ct}' \\ & = \lambda \mathbf{S}_{ct} \hat{\mathbf{\Omega}}_{hf-bts,D} \mathbf{S}_{ct}' + (1 - \lambda) \mathbf{S}_{ct} \hat{\mathbf{\Omega}}_{hf-bts} \mathbf{S}_{ct}'. \end{aligned}$$

The high-frequency time series representation (the second equivalence) can be derived in the following manner:

$$\begin{aligned} \mathbf{\Omega} &= \mathbf{S}_{ct} \mathbf{\Omega}_{hf-bts} \mathbf{S}_{ct}' \\ &= (\mathbf{S}_{cs} \otimes \mathbf{S}_{te}) \mathbf{\Omega}_{hf-bts} (\mathbf{S}_{cs} \otimes \mathbf{S}_{te})' \\ &= (\mathbf{I}_n \otimes \mathbf{S}_{te}) (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*}) \mathbf{\Omega}_{hf-bts} (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*})' (\mathbf{I}_n \otimes \mathbf{S}_{te})' \\ &= (\mathbf{I}_n \otimes \mathbf{S}_{te}) \mathbf{\Omega}_{hf} (\mathbf{I}_n \otimes \mathbf{S}_{te})' \end{aligned}$$

where  $\mathbf{\Omega}_{hf} = (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*}) \mathbf{\Omega}_{hf-bts} (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*})'$  and  $\mathbf{S}_{ct} = \mathbf{S}_{cs} \otimes \mathbf{S}_{te} = (\mathbf{I}_n \otimes \mathbf{S}_{te}) (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*})$ .

We can apply the shrinkage estimator as

$$\begin{aligned} & \lambda \hat{\mathbf{\Omega}}_{hf,D} + (1 - \lambda) \hat{\mathbf{\Omega}}_{hf} \\ & \Downarrow \\ & \hat{\mathbf{\Omega}}_H = (\mathbf{I}_n \otimes \mathbf{S}_{te}) \left[ \lambda \hat{\mathbf{\Omega}}_{hf,D} + (1 - \lambda) \hat{\mathbf{\Omega}}_{hf} \right] (\mathbf{I}_n \otimes \mathbf{S}_{te})' \\ & = \lambda (\mathbf{I}_n \otimes \mathbf{S}_{te}) \hat{\mathbf{\Omega}}_{hf,D} (\mathbf{I}_n \otimes \mathbf{S}_{te})' + (1 - \lambda) (\mathbf{I}_n \otimes \mathbf{S}_{te}) \hat{\mathbf{\Omega}}_{hf} (\mathbf{I}_n \otimes \mathbf{S}_{te})'. \end{aligned}$$

The bottom time series representation (the third equivalence) follows by

$$\begin{aligned} \mathbf{\Omega} &= \mathbf{S}_{ct} \mathbf{\Omega}_{hf-bts} \mathbf{S}_{ct}' \\ &= (\mathbf{S}_{cs} \otimes \mathbf{S}_{te}) \mathbf{\Omega}_{hf-bts} (\mathbf{S}_{cs} \otimes \mathbf{S}_{te})' \\ &= (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*}) (\mathbf{I}_n \otimes \mathbf{S}_{te}) \mathbf{\Omega}_{hf-bts} (\mathbf{I}_n \otimes \mathbf{S}_{te})' (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*})' \\ &= (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*}) \mathbf{\Omega}_{bts} (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*})', \end{aligned}$$

where  $\mathbf{\Omega}_{bts} = (\mathbf{I}_n \otimes \mathbf{S}_{te}) \mathbf{\Omega}_{hf-bts} (\mathbf{I}_n \otimes \mathbf{S}_{te})'$  and  $\mathbf{S}_{ct} = \mathbf{S}_{cs} \otimes \mathbf{S}_{te} = (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*}) (\mathbf{I}_n \otimes \mathbf{S}_{te})$ . Finally we have that

$$\lambda \hat{\mathbf{\Omega}}_{bts,D} + (1 - \lambda) \hat{\mathbf{\Omega}}_{bts}$$

**Figure A.1:** The four graphs on the left represent the number of different parameters in the covariance matrix for the various approaches presented for different values of  $m$  and  $n$  ( $n_b$ , the number of bottom time series, is about 60% of the total). On the right, we have the boxplot of the percentage reduction in the number of parameters compared to the global approach.

$$\begin{aligned}
 \Downarrow \\
 \hat{\Omega}_B &= (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*}) \left[ \lambda \hat{\Omega}_{bts,D} + (1 - \lambda) \hat{\Omega}_{bts} \right] (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*})' \\
 &= \lambda (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*}) \hat{\Omega}_{bts,D} (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*})' + \\
 &\quad (1 - \lambda) (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*}) \hat{\Omega}_{bts} (\mathbf{S}_{cs} \otimes \mathbf{I}_{m+k^*})'.
 \end{aligned}$$

In general, the covariance matrix of the reconciled forecasts is equal to  $\mathbf{M} \hat{\Omega} \mathbf{M}'$  where  $\mathbf{M} = \mathbf{S}_{ct} \mathbf{G}$  is the projection matrix. When using the HB approach, the covariance matrix of the reconciliation and the base forecasts will be identical. Indeed, it can be shown (see Panagiotelis et al. 2021 for more details) that if  $\mathbf{M}$  is a projection matrix (6) then  $\mathbf{M} \mathbf{S}_{ct} = \mathbf{S}_{ct} \mathbf{G} \mathbf{S}_{ct} = \mathbf{S}_{ct}$ , and we obtain that

$$\begin{aligned}
 \mathbf{M} \hat{\Omega}_{HB} \mathbf{M}' &= \mathbf{M} \mathbf{S}_{ct} \hat{\Omega}_{hf-bts,HB} \mathbf{S}_{ct}' \mathbf{M}' \\
 &= \mathbf{S}_{ct} \mathbf{G} \mathbf{S}_{ct} \hat{\Omega}_{hf-bts,HB} \mathbf{S}_{ct}' \mathbf{G}' \mathbf{S}_{ct}' \\
 &= \mathbf{S}_{ct} \hat{\Omega}_{hf-bts,HB} \mathbf{S}_{ct}' = \hat{\Omega}_{HB}.
 \end{aligned}$$

Figure A.1 shows the number of parameters for different values of  $m$  and  $n$ , with  $n_b$  fixed to approximately 60% of  $n$ . The right panel reports the boxplot of the percentage reductions in the number of parameters compared to the global approach.

## B Cross-temporal covariance matrix for the Monte Carlo simulation

We assume two AR(2) processes with correlated errors such that

$$y_{i,t} = \phi_{i,1}y_{i,t-1} + \phi_{i,2}y_{i,t-2} + \varepsilon_{i,t}$$

where  $\varepsilon_t \sim \mathcal{N}_2(\mathbf{0}_{(2 \times 1)}, \mathbf{\Omega}_{cs})$  and  $i \in \{B, C\}$ . Let  $y_{i,T+h}$  be the true observation for the  $i^{th}$  series and  $\tilde{y}_{i,T+h}$  the corresponding forecasts such that

$$\begin{aligned} y_{i,T+1} &= \phi_{i,1}y_{i,T} + \phi_{i,2}y_{i,T-1} + \varepsilon_{i,T+1} & \text{and} & & \tilde{y}_{i,T+1} &= \phi_{i,1}y_{i,T} + \phi_{i,2}y_{i,T-1} \\ y_{i,T+2} &= \phi_{i,1}y_{i,T+1} + \phi_{i,2}y_{i,T} + \varepsilon_{i,T+2} & & & \tilde{y}_{i,T+2} &= \phi_{i,1}\tilde{y}_{i,T+1} + \phi_{i,2}y_{i,T} \end{aligned} ,$$

then

$$\begin{aligned} y_{i,T+1} - \tilde{y}_{i,T+1} &= \varepsilon_{i,T+1} \\ y_{i,T+2} - \tilde{y}_{i,T+2} &= \varepsilon_{i,T+2} + \phi_{i,1}\varepsilon_{i,T+1}. \end{aligned}$$

Finally, we can compute each element of the high frequency bottom time series covariance matrix

$$\begin{aligned} Var(y_{i,T+1} - \tilde{y}_{i,T+1}) &= \sigma_i^2, \quad \forall i \in \{B, C\} \\ Var(y_{i,T+2} - \tilde{y}_{i,T+2}) &= \sigma_i^2(1 + \phi_{i,1}^2), \quad \forall i \in \{B, C\} \\ Cov[(y_{i,T+2} - \tilde{y}_{i,T+2}), (y_{i,T+1} - \tilde{y}_{i,T+1})] &= Cov[(y_{i,T+1} - \tilde{y}_{i,T+1}), (y_{i,T+2} - \tilde{y}_{i,T+2})] \\ &= \phi_{i,1}\sigma_i^2, \quad \forall i \in \{B, C\} \\ Cov[(y_{i,T+1} - \tilde{y}_{i,T+1}), (y_{j,T+1} - \tilde{y}_{j,T+1})] &= Cov[(y_{j,T+1} - \tilde{y}_{j,T+1}), (y_{i,T+1} - \tilde{y}_{i,T+1})] \\ &= \sigma_{i,j}, \quad \forall i, j \in \{B, C\}, \quad i \neq j \\ Cov[(y_{i,T+2} - \tilde{y}_{i,T+2}), (y_{j,T+1} - \tilde{y}_{j,T+1})] &= Cov[(y_{j,T+1} - \tilde{y}_{j,T+1}), (y_{i,T+2} - \tilde{y}_{i,T+2})] \\ &= \phi_{i,1}\sigma_{i,j}, \quad \forall i, j \in \{B, C\}, \quad i \neq j \\ Cov[(y_{i,T+2} - \tilde{y}_{i,T+2}), (y_{j,T+2} - \tilde{y}_{j,T+2})] &= Cov[(y_{j,T+2} - \tilde{y}_{j,T+2}), (y_{i,T+2} - \tilde{y}_{i,T+2})] \\ &= \sigma_{i,j}(1 + \phi_{i,1}\phi_{j,1}), \quad \forall i, j \in \{B, C\}, \quad i \neq j. \end{aligned}$$

In conclusion,

$$\mathbf{\Omega}_{hf-bts} = \begin{bmatrix} \sigma_B^2 & \phi_{B,1}\sigma_B^2 & \sigma_B^2(1 + \phi_{B,1}^2) \\ \sigma_{BC} & \phi_{B,1}\sigma_{BC} & \sigma_C^2 \\ \phi_{C,1}\sigma_{BC} & \sigma_{BC}(1 + \phi_{B,1}\phi_{C,1}) & \phi_{C,1}\sigma_C^2 & \sigma_C^2(1 + \phi_{C,1}^2) \end{bmatrix}$$

and

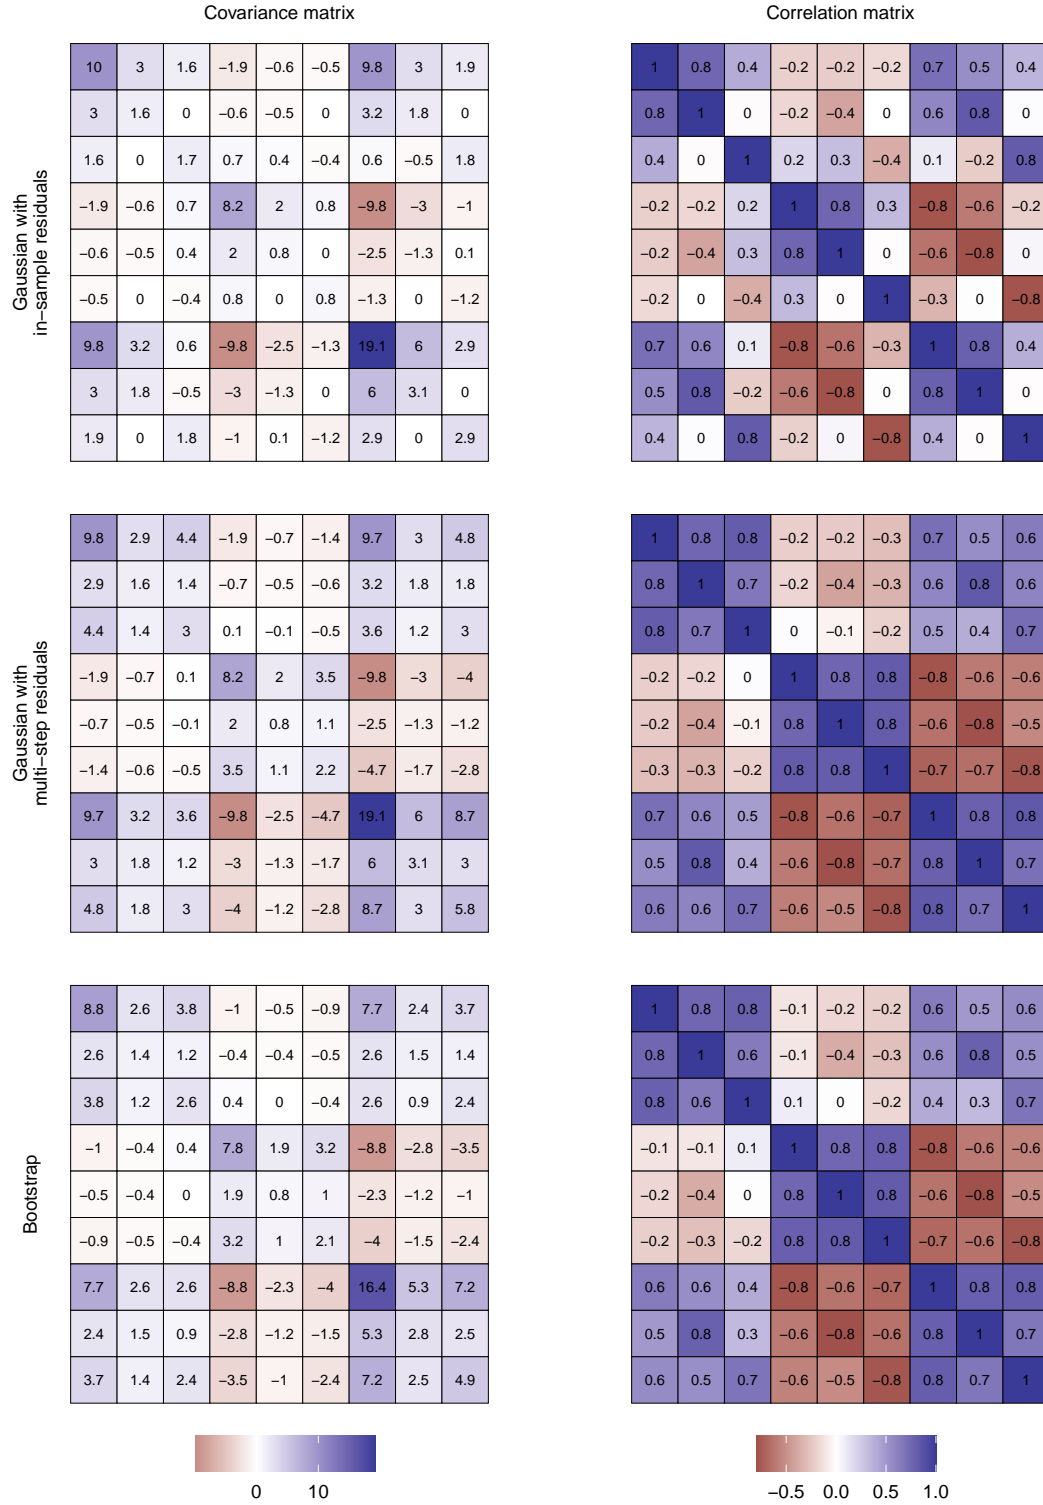

$$\mathbf{\Omega}_{ct} = \mathbf{S}_{ct}\mathbf{\Omega}_{hf-bts}\mathbf{S}_{ct}'.$$

## C Monte Carlo Simulation: one-step residuals and shrinkage covariance matrix

In Section 4.1, we discussed the use of one-step residuals in estimating the covariance matrix. In particular we point out that one-step residuals lead to a biased estimate of the covariance matrix where some correlation are zeros by definition (see Figure C.2). In addition, Tables C.1, C.2 and C.3 show the Frobenius norm, CRPS, and ES skill scores as explained in the paper to investigate the effectiveness of one-step residuals. Moreover, in Tables C.4 and C.5, we have utilized a shrinkage matrix rather than the sample covariance matrix to assess the performance of our approach.

**Table C.2:** Simulation experiment. AvgRelCRPS defined in Section 5.1. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach                    | Generation of the base forecasts paths      |                     |       |       |       |                      |       |       |       |
|--|---|---------------------|-------|-------|-------|----------------------|-------|-------|-------|

**Table C.3:** Simulation experiment. ES ratio indices defined in Section 5.1. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach                    | Generation of the base forecasts paths         |                     |       |       |       |                      |       |       |       |
|--|--|---------------------|-------|-------|-------|----------------------|-------|-------|-------|

**Table C.4:** Simulation experiment. AvgRelCRPS defined in Section 5.1. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach                    | Generation of the base forecasts paths         |                     |       |       |       |                      |       |       |       |
|--|--|---------------------|-------|-------|-------|----------------------|-------|-------|-------|

**Table C.5:** Simulation experiment. ES ratio indices defined in Section 5.1. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

## D Forecast reconciliation of the Australian GDP dataset

Athanasopoulos et al. (2020) proposed using state-of-the-art forecast reconciliation methods to improve the accuracy of macroeconomic forecasts and facilitate aligned decision-making. In their empirical analysis, they applied cross-sectional forecast reconciliation to 95 Australian QNA time series that represent the Gross Domestic Product (GDP) calculated using both the income and expenditure approaches. These two approaches correspond to two distinct hierarchical structures, with GDP at the top and 15 lower-level aggregates in the income approach, and GDP as the top-level aggregate in a hierarchy of 79 time series in the expenditure approach (for more information, see Athanasopoulos et al. 2020, pp. 702–705 and figures 21.4–21.7). Bisaglia et al. (2020) showed how to obtain a “one-number” forecast where the GDP reconciled forecasts are coherent for both the expenditure and income sides. Di Fonzo & Girolimetto (2022c,d) extended the one number forecasts idea to obtain fully reconciled probabilistic forecasts, and Di Fonzo & Girolimetto (2023a) computed cross-temporally reconciled point forecasts.

### D.1 One-step residuals and shrinkage covariance matrix

| Reconciliation approach      | Generation of the base forecasts paths |                             |              |              |              |              |                    |              |              |              |

\*The Gaussian method employs a sample covariance matrix:

$G_h$  and  $H_h$  use multi-step residuals and  $G_{oh}$  and  $H_{oh}$  use overlapping and multi-step residuals.

**Table D.6:** AvgRelCRPS indices defined in Section 5.1 for the Australian QNA dataset. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach      | Generation of the base forecasts paths |                             |              |              |              |              |                    |              |              |              |

\*The Gaussian method employs a sample covariance matrix:

$G_h$  and  $H_h$  use multi-step residuals and  $G_{oh}$  and  $H_{oh}$  use overlapping and multi-step residuals.

**Table D.7:** ES ratio indices defined in Section 5.1 for the Australian QNA dataset. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach                                  | Generation of the base forecasts paths |                    |                |                 |                 |       |                    |                |                 |                 |

\*The Gaussian method employs a shrinkage covariance matrix:

$G_h$  and  $H_h$  use multi-step residuals and  $G_{oh}$  and  $H_{oh}$  use overlapping and multi-step residuals.

**Table D.8:** AvgRelCRPS indices defined in Section 5.1 for the Australian QNA dataset. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach      | Generation of the base forecasts paths |                             |              |              |              |              |                    |              |              |              |

\*The Gaussian method employs a shrinkage covariance matrix:

$G_h$  and  $H_h$  use multi-step residuals and  $G_{oh}$  and  $H_{oh}$  use overlapping and multi-step residuals.

**Table D.9:** ES ratio indices defined in Section 5.1 for the Australian QNA dataset. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

## E Australian Tourism Demand dataset

**Table E.10:** Geographic divisions of Australia in States, Zones e Regions. Zones formed by a single region are highlighted in italics and not numbered.

## E.1 Dealing with negative reconciled forecasts

One issue in working with time series data is the presence of negative values, which can cause difficulties for certain types of models or analyses. For the base forecasts, using the bootstrap approach produces forecasts naturally non negative (ETS model with the log-transformation), while this is not true for the Gaussian approach. In this case, any negative forecast is set equal to zero. For the cross-temporal reconciliation, Di Fonzo & Girolimetto (2022a, 2023b) propose two solutions: either a state-of-the-art numerical optimization procedure (osqp, Stellato et al. 2020, 2022), or a simple heuristic strategy called set-negative-to-zero (sntz). With sntz, any negative high frequency bottom time series reconciled forecasts are set to zero, and then a cross-temporal reconciliation bottom-up is used to obtain the complete set of fully coherent forecasts. Di Fonzo & Girolimetto (2023b) found that both methods produce similar quality forecasts, but the optimization method required much more time and computational effort compared to the sntz heuristic. To reduce computational demands, we used the less time-intensive heuristic approach for reconciliation.

## E.2 Tables for all the temporal aggregation orders

| Reconciliation approach                    | Generation of the base forecasts paths |                                       |              |              |              |              |                    |              |              |              |

\*The Gaussian method employs a sample covariance matrix and includes four techniques (G, B, H, HB) with multi-step residuals.

**Table E.11:** AvgRelCRPS defined in Section 5.1 for the Australian Tourism Demand dataset. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach                    | Generation of the base forecasts paths |                                       |              |              |              |              |                    |              |              |              |

\*The Gaussian method employs a sample covariance matrix and includes four techniques (G, B, H, HB) with multi-step residuals.

**Table E.12:** ES ratio indices defined in Section 5.1 for the Australian Tourism Demand dataset. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach                    | Generation of the base forecasts paths |                                       |              |              |              |              |                    |              |              |              |

\*The Gaussian method employs a shrinkage covariance matrix and includes four techniques (G, B, H, HB) with multi-step residuals..

**Table E.13:** AvgRelCRPS defined in Section 5.1 for the Australian Tourism Demand dataset. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.

| Reconciliation approach                    | Generation of the base forecasts paths |                                       |              |              |              |              |                    |              |              |              |

\*The Gaussian method employs a shrinkage covariance matrix and includes four techniques (G, B, H, HB) with multi-step residuals.

**Table E.14:** ES ratio indices defined in Section 5.1 for the Australian Tourism Demand dataset. Approaches performing worse than the benchmark (bootstrap base forecasts, ctjb) are highlighted in red, the best for each column is marked in bold, and the overall lowest value is highlighted in blue. The reconciliation approaches are described in Table 2.
